BACKGROUND

Description

PPP3CA, also known as Calcineurin A, is a major soluble calmodulin binding protein in the brain, a Ca^{2+} /calmodulin dependent serine/threonine protein phosphatase, with a relatively narrow substrate specificity. It activates the T cells of the immune system and can be blocked by drugs. PPP3CA activates NFATc, a transcription factor by dephosphorylating it. The activated NFATc is then translocated into the nucleus, where it

upregulates the expression of interleukin 2. Recombinant human PPP3CA protein, fused to His-tag at N-terminus, was expressed in E. coli and purified by using conventional chromatography techniques.
